

Streamline dealership operations with a Superservice Menu network

Superservice MenuTM can be networked from a single server within a dealership or across a group of dealers. Depending on your needs, Superservice Menu settings, saved quotations and warranty claims can be accessed from a central location and used by all authorised users.

One or all of the following networking options may be utilised:

Networked Preferences & Settings

Superservice Menu is installed on the computer of each user. The common Preferences and Settings are stored on one computer, which acts as a server. The Preferences and Settings are then shared by all users who have access to the network. The dealer only needs to update and maintain one file. This allows users to:

- Access the same labour rates, parts pricing and sundry rates, providing consistent menu pricing across the dealership.
- Access saved quotations, which ensures customers can always be provided with their quotation, even if served by a different person.
- Check for outstanding quotations within the dealership.

Networked Data

Superservice Menu is installed on the computer of each user.

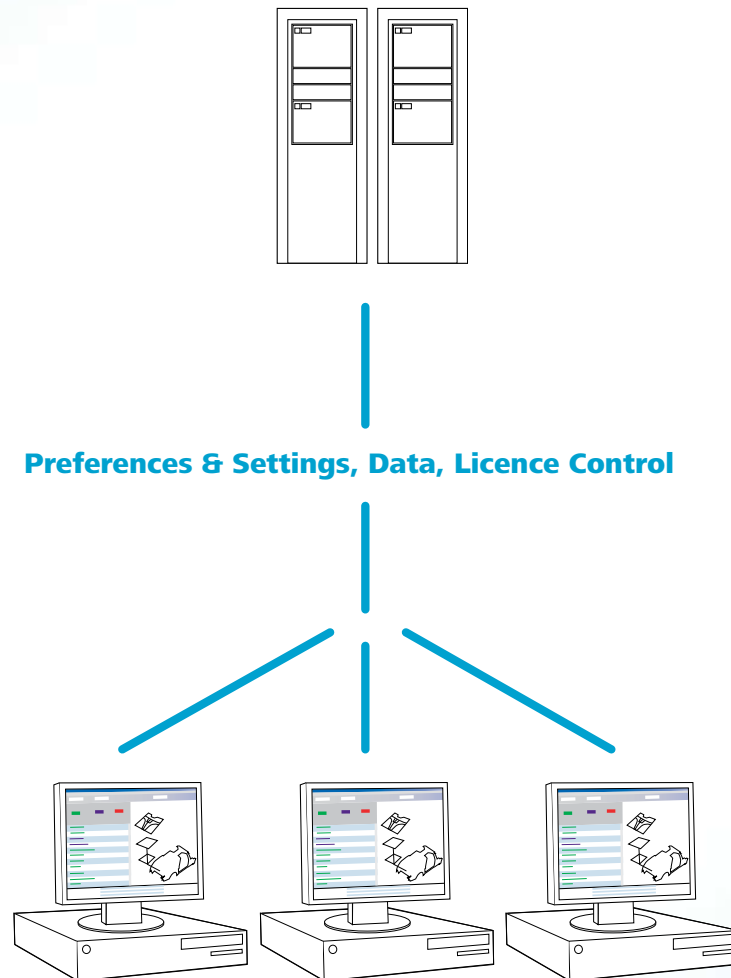

The application data is installed on a server and can then be shared by all users who have access to the network.

- The System Administrator only updates one data file each month.
- The Superservice Menu application on each user's computer is updated automatically each month.

Networked Licence Control

Superservice Menu is available from any computer connected to the network, provided that the number of users at any time does not exceed the number of authorised licences owned by the dealership.

- Superservice Menu can be used from anywhere in your dealership. Therefore, you do not need to install dedicated licences on every computer.
